

where applicable, are interchangeable and can be used in a selected embodiment, even if not specifically shown or described. The same may also be varied in many ways. Such variations are not to be regarded as a departure from the disclosure, and all such modifications are intended to be included within the scope of the disclosure.

The invention claimed is:

1. A medication bottle comprising:
 - (a) an outer container wall;
 - (b) an inner container wall comprising multiple separate compartments located between the inner and outer container walls, the compartments being further bordered by spaced apart projections of the container walls being in contact with each other along side wall sections thereof;
 - (c) a cavity located within a center of the inner wall with an openly accessible end configured to receive medication;
 - (d) an aversive liquid located in the compartments;
 - (e) a cap configured to be removably coupled to the outer container wall;
 - (f) a user-biometric sensor affixed to the cap; and
 - (g) at least a second sensor affixed to the cap.
2. The bottle of claim 1, wherein the biometric sensor includes a fingerprint scanner.
3. The bottle of claim 1, wherein the biometric sensor includes a user-viewing camera and software.
4. The bottle of claim 1, wherein the biometric sensor includes a user voice recognition microphone and software.
5. The bottle of claim 1, wherein the second sensor includes a camera viewing into the cavity.
6. The bottle of claim 1, wherein the second sensor includes an RFID reader.
7. The bottle of claim 1, further comprising an electromagnetic actuator and a lock mounted to the cap, authentication of the user by a microprocessor attached to the cap causing the actuator to move the lock which allows the user to open the cap.
8. The bottle of claim 1, wherein the aversive liquid is at least one of: (a) an emetic compound, (b) a pungent compound, or (c) a gastric irritant compound, which is released into the cavity through the inner container wall when undesired tampering of the bottle occurs, which causes the aversive liquid to contaminate the medication in the cavity.
9. A medication bottle comprising:
 - (a) an outer container wall including a side wall section and a bottom wall section;
 - (b) an inner container wall including a side wall section, corresponding with the side wall section of the outer container wall, and a bottom wall section substantially corresponding with the bottom wall section of the outer container wall;
 - (c) a user-accessible cavity being inside the inner container wall; and
 - (d) a medication-changing fluid located between the container walls in a nominal condition but the fluid moving into the cavity in a container-tampering condition.
10. The bottle of claim 9, further comprising:
 - a cap removeably coupled to the outer container wall; and
 - at least one sensor mounted to the cap.
11. The bottle of claim 10, wherein the sensor is a biometric sensor.
12. The bottle of claim 10, wherein there are at least two of the sensors which sense different user-authentication features.
13. The bottle of claim 10, further comprising:
 - a lock mounted to the cap;
 - an electromagnetic actuator; and
 - authentication of the user by a microprocessor attached to the bottle causing the actuator to unlock the lock which allows the user to open the cap.
14. The bottle of claim 9, wherein the fluid is an aversive liquid is at least one of: (a) an emetic compound, (b) a pungent compound, or (c) a gastric irritant compound, which is released into the cavity through the inner container wall when undesired tampering of the bottle occurs, which causes the aversive liquid to contaminate medication in the cavity.
15. The bottle of claim 9, further comprising multiple spaced apart channels defined between projections of the inner container wall which are bonded to the outer container wall, and the fluid being located in the channels in the nominal condition.
16. The bottle of claim 9, further comprising addictive or pain reducing tablet pills or capsules located in the cavity and operably covered by the fluid in the tampering condition.
17. A medication bottle comprising:
 - (a) an outer container wall;
 - (b) an inner container wall comprising multiple separate compartments located between the inner and outer container walls, the compartments being bordered by spaced apart portions of the container walls being in contact with each other along side wall sections thereof; and
 - (c) a user-accessible cavity being inside the inner container walls.
18. The bottle of claim 17, further comprising:
 - a cap removeably coupled to the outer container wall; and
 - at least one sensor mounted to the cap.
19. The bottle of claim 18, wherein the sensor is a biometric sensor.
20. The bottle of claim 18, wherein there are at least two of the sensors which sense different user-authentication features.
21. The bottle of claim 18, further comprising an electromagnetic actuator and a lock mounted to the cap, authentication of the user by a microprocessor attached to the cap causing the actuator to move the lock which allows the user to open the cap.
22. The bottle of claim 17, further comprising an aversive liquid located in the compartments, the liquid being at least one of: (a) an emetic compound, (b) a pungent compound, or (c) a gastric irritant compound, which is released into the cavity through the inner container wall when undesired tampering of the bottle occurs, which causes the aversive liquid to contaminate medication in the cavity.
23. The bottle of claim 22, further comprising addictive or pain reducing tablet pills or capsules located in the cavity and operably contacted by the liquid in the tampering condition.
24. The bottle of claim 17, wherein:
 - the compartments are fluid-carrying compartments which are each circular when viewed from an open top, and
 - are coaxial with a centerline of the cavity which extends through the open top;
